Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues

Claim 49; Page 32; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

```
peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides) and a cyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis,

To cyclisation are used to interfere with angiogenesis,

Characterised by angiogenesis, newsscularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy,

Cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive cerebrovascular accident, post-angioplasty restenosis, head, heat or claimed, hypertension induced neovascular sequelae, hypertension induced neovascular sequelae, hypertension induced neovascular sequelae, hypertension induced neovascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to induced blood vessels and lymphatic or brain. The peptides are used to induce by VEGF. Or D and are also used in combination with an anti-inflammatory agent, to treat a continual accident inflammatory agent, to treat a continual accident inflammatory agent, to treat a continual accident activity induced by VEGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ó

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human CV USCFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-control of peptide by a measuring beta-control of peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior corplication are used to interfere with angiogenesis, coryclisation are used to interfere with angiogenesis, coryclication or lymphangiogenesis.

The condition is diabetic retinopathy, pooriasis, arthropathy, correctorised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, pooriasis, arthropathy, correctorised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, pooriasis, arthropathy, correctorised by angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability cor brain. The peptides are used to image blood vessels and lymphatic arc used to image blood vessels and lymphatic with at least one biological activity induced by VBGF, very and are also used in combination with an anti-inflammatory agent, to treat a correction inflammation, with an anti-inflammatory agent, to treat a corporation of periods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

Whose 3 dimensional structure is modelled on the expose loop of human CVSCPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabet a carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, a condition to Tymphangiogenesis in a mammal with a condition convacularisation or lymphangiogenesis, neovascularisation is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tunnour, post-recovery creaborascular accident, post-rangioplasty restenosis, head, heat or cold trauma, substance-induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid a committed angiogenic disperse in mammal (the mammal has a condition characterised by fluid a committed more related angiogenic disperse in mammal (the mammal has a condition characterised by fluid a committed for modulate vascular permeability or brain the rephylement lines or in lungs, peritonal capitic, or brain the relation are determined to manual has a condition characterised by fluid accumulation in peripheral lines are also used to modulate accumulation; when peritons are need to modulate accumulation in a mammal has a condition characterised by fluid accumulation in the peripheral lines are also used to modulate accumulation; when peritons are need to modulate accumulation in the peripheral lines are also used to modulate accumulation in the peripheral lines are also used to modulate accumulation in the peripheral lines are also used to modulate accumulation in a mammal has a condition of the liver. Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine treat a sequence represents a monomeric monocyclic peptide of the invention, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VGGF, VGGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retinopathy Example 25; Page 47; 102pp; English WPI; 2001-442248/47.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VESPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betace carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior neovascularisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis, neovascularisation or lymphangiogenesis, arthropathy, homangiome, head continued maintended prince the manner of the condition is diabetic retinopathy, psoriasis, arthropathy, homangiomens. Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine cerebrovascular accident, post-angioplasty restenosis, head, heat or col trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to tree chronic inflammation, especially rheumatoid arthritis, psoriasis and 89.1%; Score 41; DB 4; Length 8; 75.0%; Pred. The peptide is conformationally constrained by groups attached to each side. The peptide mimics a beta turn and can bind to at least one HIV envelope protein, thus inhibiting infection. It inhibits the interaction between HIV envelope glycoproteins and human cell-surface protein CD4 by mimicking structures of CD4. See also AAR24950-R24959 and AAR25122.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human vaces 3-dimensional structure is modelled on the expose loop of human conversed to the invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-conversed loop fragment from an exposed loop of a growth factor protein and cyclising the peptide with at least one amino acid deleted prior peptides, dimeric bicyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.

The condition is diabetic relinopathy, psoriasis, arthropathy, chemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascular sequelae, or chronic liver sequelae, hypertension induced neovascular sequelae, or chronic liver communication. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by luid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are also used to indepte and lustic contracterised by luid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are also used to indepte are used to interfere with at least one biological activity induced by VEGF. VEGF-C or -D and are also used in combination with an uni-inflammatory agent, to treat a decident of the liver and and activity induced by VEGF. Cor -D and are also used in combination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a target antigenic peptide derived from the CDR2-like domain of the human CD4 protein. The peptide is cyclised by the CDR2-like domain of cysteine residues at either end. The specification describes antigenic peptides derived from the CDR2-like domain of CD4 ending a coids 27-66 of ANY54500). These antigenic peptides present neutralising receptor/co-receptor effects sites of the CDR2-like domain. The peptides evoke effective antibody responses by having optimised sitespecificity. The induced antibodies block human immune deficiency virus (HVV) binding and syncytia formation. They may also block CD4-class II interactions with other cells deliver signals to T cells (inhibiting normal CD4+-mediated immunoregulatory functions) or induce apportises of containing the antiggament of T cell receptors. Conjugates and peptides containing the antiggament of T cell receptors. Conjugates and peptides containing the antiggament of T cell receptors. Conjugates and peptides containing the antiggament of T cell surface complexes, peptides containing the antiggament of T cell surface complexes, conformation to generate antibodies against CD4 and thus HIV infection, but a specially to prevent binding of HIV to CD4 and thus HIV infection, con autoimmune diseases (rheumatoid arthritis, systemic lupus corrections which are broadly neutralising against primary isolates from all classes of HIV-1 and of HIV-2. The peptides may include a promiscuous corrections are peptides may include a promiscuous corrections and includes which are broadly neutralising against primary isolates from all classes of HIV-2 and genetically diverse subjects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The present invention relates to polypeptides that bind cellular receptors for vascular endothelial growth factors (VEGFs), the polymucleotides encoding them, and their use for identifying agents that modulate interactions between VEGFs and their receptors. VEGFs and their receptors play an important role in vasculogenesis, the development of the embryonic vasculature from early differentiating endothelial cells and angiogenesis, the process of forming new blood vessels from presents include cancers, abnormal angiogenesis, receptors may be used to treat dysfunction of the endothelial cell regulatory proliferative retinopathies, age-related macular degeneration, rheumatoid arthritis and psoriasis. The polypeptides of the invention exhibit unique arthritis and psoriasis. The polypeptides of the invention exhibit unique arthritis represent the peptides Alvos which are encoded by human VEGFA forward primers used in the methods of the present invention
                                                                                                                Human, vascular endothelial growth factor, VEGP-A; vasculogenesis, angiogenesis, blood vessel, cancer, proliferative retinopathy; psoriasis, age-related macular degeneration; rheumatoid arthritis; cardiovascular;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polypeptides that bind cellular receptors for vascular endothelial growth factors, polynucleotides encoding them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 26; DB 4; Length 8;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence is an immunogenic fragment of feline immunodeficiency virus (FIV) glycoprotein 130. Peptides AAY57038-Y57039 (also fragments of gp130) are used in the invention as capture polypeptides when diagnosing FIV infection. The invention relates to an antibody binding composition immunogenic fragment of FIV gag precursor p55, and a second fragment which is part of the env precursor p55, and an antibody-binding which is part of the env precursor gp130, and an antibody-binding performing an assay which determines whether a feline is infected with Immunodeficiency Virus infection

```
Protein polymers comprising repeating units and sequences - capable of enzyme-catalysed covalent bond formation useful as a biocompatible material for wound closure and tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protein polymer; adhesive sealant; wound healing; cross-linking.

This is an example of a glutamine donor peptide that can be utilised in novel recombinant protein polymers of the invention. Such polymers (see AAW49710-28) typically comprise a repetitive amino acid backbone of repetitive units having a collagen, fibroin, elastin or keratin motif at least 2 enzyme recognition sequences comprising a glutamine and/or lysine capable of enzyme catalysed isopeptide formation. The polymers are capable of covalent crosslinking by enzymatic reaction to form products which set quickly and have good adhesive properties and high strength. They can be used as medical adhesives and sealants, in the closure of wounds and repair of damaged tissues, prosthesis coatings, drug depots, and matrices for the transplantation of cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The peptides AAR80351-70 are examples of glutamine donor peptides which can be used to generate protein polymeric adhesion substrate (PPAS) contg. repeats of non-fibrin cross-linking donor peptide sequences (see AAR80345-50 for examples of PRAS proteins). The PPAS proteins can be used as substrates in enzymatic cross-linking reactions catalysed by a transglutaminase enzyme e.g. Factor VIII or XIII. The polymers can be used in biological systems where in situ formation of a biocompatible material with structural integrity is required e.g. as medical adhesives and sealants or for wound closure or tissue repair
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The present invention describes peptides that selectively home to a tissue or organ. The peptides can be used for identifying an organ or tissue, for identifying a target molecule expressed by an organ or tissue or for treating an organ or tissue pathology, where the organ or tissue is selected from prostate, lung, skin, retina, pancreas, gut, ovary, adrenal gland, liver, and lymph node. The peptide bind to the membrane dipeptidase (MDP). AAY48618 to AAY49066 represent sequences which are used in the exemplification of the present invention. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                  Targeting peptide; cancer; Hodgkin's disease; cytostatic; immunosuppressive; anti-inflammatory; antiarthritc; antiviral; antiatheroscalerotic; antidatebetto; antibacterial; diabetes mellitus; inflammatory disease; arthritis; atherosclerosis; cancer; autoimmune disease; bacterial infection; viral infection.

This invention relates to a novel method for identifying disease targeting peptides. The method comprises exposing a sample from an organ, tissue or call type of interest, to a phage display library and recovering phage bound to the sample (the phage expresses targeting peptides). The peptides identified by the method of the invention may have cytostatic, immunosupressive, anti-inflammatory, antiarthritic, antiatherosclerotic, antidabetic, antibacterial and antiviral activities. The methods and composition are useful for identifying targeting peptides and one or more receptors for a targeting peptide. The targeting peptides are used for selective delivery of therapeutic agents, including gene therapy vectors and fusion proteins, to specific organs, tissues, or cell types in subject. The targeting peptide may also be used

Identifying targeting peptides useful for treating e.g. diabetes mellitus, inflammatory diseases, cancer, or autoimmune diseases, comprises exposing a sample to a phage display library and recovering phage bound to the sample.

Sequence 133, Application US/09795006A
Patent No. US20020151680A1
GENERAL INFORMATION
GENERAL INFORMATION: MATERIALS AND METHODS INVOLVING HYBRID VASCULAR
TITLE OF INVENTION: RNOTHELIAL GROWTH FACTOR DNAS AND PROTEINS
TITLE OF INVENTION: RNOTHELIAL GROWTH FACTOR DNAS AND PROTEINS
TITLE OF INVENTION: BNOTHELIAL GROWTH FACTOR DNAS AND PROTEINS
CURRENT APPLICATION NUMBER: US/09/795,006A
CURRENT FILING DATE: 2001-02-26
PRIOR APPLICATION UNDER: US 60/205,331
PRIOR PILING DATE: 2000-05-18
PRIOR APPLICATION NUMBER: US 60/185,205
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            US-09-761-636A-21

geguence 214, Application US/09258754

general No. 6174687

GENERAL INFORMATION:
APPLICANT: Rueslahti, Erkki
APPLICANT: Rajotte, Daniel
TITLE OF INVENTION: Methods of Identifying Lung Homing Molecules Using
TITLE OF INVENTION: Membrane Dipeptidase
FILE REFERENCE: P-LJ 3443

CURRENT APPLICATION NUMBER: US/09/226

CURRENT APPLICATION NUMBER: 09/042,107

EARLIER FILING DATE: 1998-03-13

NUMBER OF SEQ ID NOS: 452

SOFTWARE: PATCHILING UNC: 2.0

                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Olivera B.M.;
"A novel D-leucine-containing Conus peptide: diverse conformational dynamics in the contryphan family.";
"J. Pept. Res. 54:39-39 (1999).
-! SUBCELLULAR LOCATION: Secreted.
-! TISSUE SPECTROMETRY: Expressed by the venom duct.
-! MASS SPECTROMETRY: WW-888.4; METHOD-LSIMS.
-! SIMILARITY: Belongs to the contryphan family.
TOXIN; Hydroxylation; D-amino acid.
DISULFID.

"Lambda-conotoxins, a new family of conotoxins with unique disulfide
if pattern and protein folding isolation and characterization from the
ryenno of Conus marmoreus."

1. Diol. Chem. 275:39516-39522(2000).

1. FUNCTION: Inhibits the neuronal noradrenaline transporter.

2. SUBCELDULAR LOCATION: Secreted.

1. SUBCELDULAR LOCATION: Expressed by the venom duct.

2. INSS SPECTREOMERRY: MW=123-33, MW ERR=0.21; METHOD=Electrospray.

3. SIMILARITY: Belongs to the chi/lambda-conotoxin family.

Varinary structure of two neuropeptide hormones with adipokinetic and hypotrephalosemic activity isolated from the corpora cardiaca of horse Proc. Natl. Acad. Sci. U.S.A. 86:8161-8164 (1989).

-I-FUNCTION: This hormone, released from cells in the corpora cardiaca after the beginning of flight, causes release of diglycerides from the fat body and then stimulates the flight muscles to use these diglycerides as an energy source.
                                                                                                                                                                                                                                                                                                                                                                 Gaps

Gaede G., Kellner R., Rinehart K.L. Jr., Proefke M.L.;

"A tryptophan-substituted member of the AKH/RPCH family isolated from a stick insect corpus cardiacum.";

Biochem. Biophys. Res. Commun. 189:1303-1309 (1992)

-! FUNCTION: Hypertrahalosaemic factors are neuropeptides that elevate the level of trehalose in the hemolymph (trehalose is the major carbohydrate in the hemolymph of insects).

-! SUBCELLULAR LOCATION: Secreted.

-!- FUNCTION: This peptide both inhibits the activity of the angiotensin-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SPECIES=C.morosus; TISSUE=Corpora cardiaca; MEDLINE=87157103; PubMed=3828078; Gaede G., Rinehart K.L. Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues

Claim 49; Page 32; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

residues.

```
peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, concaveration or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, corpered or accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive cremena, substance-induced neovascularisation of the liver, excessive commone-related angiogenic dysfunction, diabetes induced neovascular gequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability or brain. The peptides are used to induced by fund cavity, pleura, or brain. The peptides are used to induced by Oserlae and Lymphatic or brain. The peptides are used to induced by VEGF. Or bend of are also used in combination with an anti-inflammatory agent, to treat a continuation in peripheral activity induced by VEGF. Or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

to cyclisation are used to interfere with anglogenesis.

to cyclisation are used to interfere with anglogenesis.

covascularisation or lymphangiogenesis in a mammal with a condition characterised by anglogenesis, neovascularisation or lymphangiogenesis.

Conservation is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post recovery cerebrovascular accident, post-angloplasty restenosis, head, hear or careama, substance-induced meovascularisation of the liver, excessive trauma, substance-induced neovascular sequelae, or chronic liver sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid corbination in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to inage blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                    The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human vEGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bloyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ..

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human verses of vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior cyclisation are used to interfere with angiogenesis, convascularisation or lymphangiogenesis, neovascularisation or lymphangiogenesis.

Convascularisation or lymphangiogenesis in a mammal with a condition is diabetic retinopathy, psoriasis, arthropathy, convascular accident, post-angioplasty restenosis, head, heat or cold crauma, substance-induced neovascularisation of the liver, excessive confection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are also used to indeptes and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by vEGF, VEGF-C or -D and care also used in combination with an anti-inflammatory agent, to treat a chronic inflammation in peripherally, which an entivity are provided and converse and provided are also used to interfere with at least one biological activity induced by VEGF-C or -D and chronic inflammation in converse and privity induced by vEGF-C or -D and chronic inflammation and privity induced by vEGF-C or -D and chronic inflammation in peripherally, with an enti-inflammatic architecture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       are also used in combination with an anti-inflammatory agent, to tree chronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retinopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, VBGF, vascular endothelial growth factor, angiogenesis, neovascularisation; lymphangiogenesis; psoriasis; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    88.5%; Score 54; DB 4; Length 11; 72.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  reconstruction or lymphanglogenesis, a mammal with a condition characterised by angiogenesis, neovascularisation or lymphanglogenesis, neovascularised by angiogenesis, neovascularisation or lymphanglogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold frauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, nypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limps or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a discrete control of the contro
                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior rocyclistic action are used to interfere with angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                      Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

VEGF based monocyclic peptide 10.

(first entry)

26-SEP-2001

AAU04532;

```
The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGPO (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis. The condition or lymphangiogenesis in a mammal with a condition condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive correlated angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension illuced neovascular sequelae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accomplation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by vEGF. VEGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and
diabetes induced neovascular sequelae; rheumatoid arthritis; diabetic retinopathy; chronic inflammation; cyclic.
                                                                                                       Location/Qualifiers

```
Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                    growth factor; anglogenesis;
                                                           neovascularisation; lymphangiogenesis; psoriasis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis; diabetic retinopathy; chronic inflammation; cyclic.

    10
/note= "This bond cyclises the peptide"

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human CC whose 3-dimensional structure is modelled on the expose loop of human CC whose 1-dimensional structure is modelled by the invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a cyclising the peptide hop fragment from an exposed loop of a growth factor protein and cyclising the peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, to cyclisation or lymphangiogenesis in a mammal with a condition of characterised by angiogenesis; neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, paoriasis, atthropathy, hear or cold creator accident, post-angioplasty restenosis, head, heat or cold creators underly accident, post-angioplasty restenosis, head, heat or cold crauma, substance-induced neovascular sequelae, or chromic liver, excessive condition induced neovascular sequelae, or chromic liver infaction induced neovascular sequelae, or chromic liver infaction induced neovascular sequelae, or chromic liver infaction induced neovascular sequelae. infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accountiation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. VEGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retinopathy

to cyclisation are used to interfere with angiogenesis.

to cyclisation are used to interfere with angiogenesis.

covascularisation or lymphangiogenesis in a mammal with a condition

characterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, the condition is diabetic retinopathy, psoriasis, arthropathy, that or cerebrowscular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid corumnitation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to in lungs, peritoneal cavity, pleura, or brain. The peptides are used to induced by VEGF, VEGF-C or -D and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        whose 3-dimensional structure is modelled on the expose loop of human VBGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a mesuring beta-beta carbon separation distences on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence represents a monomeric monocyclic peptide of the invention,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, VEGF, vascular endothelial growth factor; angiogenesis; neovascularisation; lymphangiogenesis; psoriasis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis;

    .9 // This bond cyclises the peptide"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       diabetic retinopathy; chronic inflammation; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Location/Qualifiers

The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidialing the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprishing 2 linked monocyclic peptides, dimeric bicyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis, no cyclisation or lymphangiogenesis in a mammal with a condition characterised by anglogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriagis, arthropathy, he manglomer, post-recovery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AARS8412-42 are overlapping 8-mer peptides of the binding domain of TSAR (Totally Synthetic Affinity Reagents) peptide TSAR (46.9-2 (AARS8411). These bind (partially) a monoclonal antibody, ie. anti-CEA (46 (anticarcinoembryonic antigen). TSAR peptides are generated using generic oligonucleotides (see AAQ70470-73 for examples). TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active.They may further comprise a linker peptide between the 2 domains. The TSARs or
             hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic or brain. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. Or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TSAR; totally synthetic affinity reagent; synthetic; binding domain; effector domain; concatenated heterofunctional protein; linker; direct, rapid; detection; screening; treatment; monoclonal antibody; MAb; C46; anti-carcinoembryonic antigen; anti-CRA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a

                                                                                                                                                                                                                                ö
               a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid molecule comprising sequences encoding the CA125 protein, useful for diagnosing, preventing and/or treating cancer, e.g. ovarian, pancreatic, breast, endometrial or lung carcinomas.
comprising a TSAR binding domain can be used in vivo to deliver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a nucleic acid molecule encoding an ovarian cancer antigen, CA125. Nucleic acid molecules, vaccine and methods are useful for diagnosing, preventing and treating cancer, e.g. pancreatic, lung, ovarian, breast or endometrial carcinoma. The invention is useful in gene therapy and as vaccines. The present sequence is CA125/MUC16 Oglycosylation site

SH2 binding peptide core sequence #21.

08-APR-1997 (first entry)

AAW12615;

```
The sequences given in AAW12551-70 represent core peptides of an src homology region 2 (SH2) binding peptide which correspond to the formula: 27-x28-X x = any D- or L- amino acid; Z7 = phosphotyrosine or its isostere: 28 = asparagine or its isostere; the amino terminus is acylated, and the peptide is less than 14 residues in length, with the proviso that if Z7 is phosphotyrosine and Z8 is asparagine, then the peptide is not GDG27xZ8xPLLL. SH2 binding peptides containing these core peptides are used to treat of diagnose diseases associated with aberrant defects in receptor tyrosine kinase pathways, by partially blocking or cancer, a developmental or differentiation disease or insulin-resistant (or non-insulin dependent) diabetes
                                                                                                                                                     Core peptide; src homology region 2 binding peptide; SH2; cell growth; differentiation; regulation; receptor tyrosine kinase pathway; cancer; signal transduction pathway; non-insulin dependent diabetes; insulin-resistant diabetes.
                                                                                                                                                                                                                                                                                                           /note= "given in the patent as pl, no further details
given. May be intended to be phosphotyrosine"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide(s) which bind to SH2 domains - are used to treat diseases associated with aberrant cell growth, differentiation or regulation associated with defects in receptor tyrosine kinase pathways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Grove JR, Hart CP, Kim MH;
